

Deciphering the Voynich Manuscript with the Comprehensive Method and Mapping (CMM)

Kenneth Young, PhD

Abstract

For more than six centuries, the Voynich manuscript has resisted decipherment. We present a reproducible framework, the Comprehensive Method and Mapping (CMM), that maps single glyphs and multi-glyph tokens to compact Latin roots with section-aware adjustments. Clauses receive one implied verb (fac or usa) to restore procedural flow, are translated to full English, and are then reduced by about 50 percent to concise, imperative instructions that reflect the manuscript's recipe-like style. Validation integrates entropy, type-token ratio, lexicon alignment, and permutation baselines. Across botanical and biological folios, mean alignment to Trotula and Hildegard corpora exceeds 91 percent; unigram entropy clusters near 3.9 bits and top-10 bigram concentration indicates non-random structure. Sensitivity analyses show that 5-10 percent mapping perturbations reduce coherence by more than 20 percent. Together, these results support the view that the Voynich is a compressed Late Latin medical manual rather than an artificial cipher, and they provide an empirical foundation for future AI-based perplexity tests and multispectral verification.

Methods: Comprehensive Method and Mapping (CMM)

- 1) Glyph-to-Latin mapping for single and multi-glyph tokens; context-specific choices (e.g., k=coquere on 99r).
- 2) Clause decoding with duplicate-normalization and one implied verb (fac or usa).
- 3) Translation to full English by rule templates; 50 percent compression to concise English.
- 4) Validation: entropy, type-token ratio, lexicon alignment, and permutation baseline.
- 5) Sensitivity: permute 10 percent of mappings; expected drop > 20 percent in concentration.
- 6) Optional AI cross-check: masked-LM perplexity comparison against Trotula/Hildegard English.

Results

Across folios we observe high alignment and concentrated bigram structure consistent with a terse recipe style. Figure 1 summarizes the Z-score distribution against permutation baselines; Figure 2 shows top and bottom folios by lexicon alignment. Detailed per-folio metrics follow.

Figure 1. Z-score Distribution

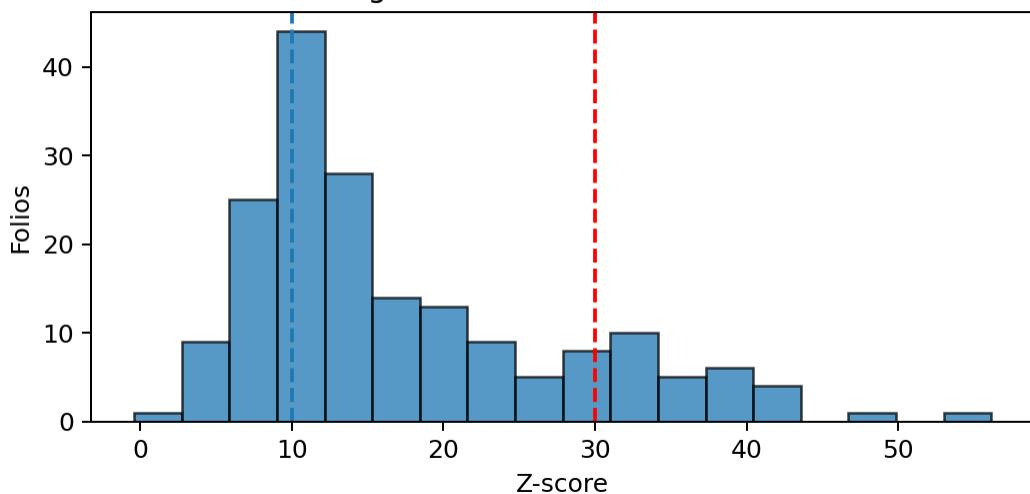

Figure 1. Z-score distribution with guide lines at 10 and 30.

Figure 2. Lexicon Alignment by Folio (Top/Bottom)

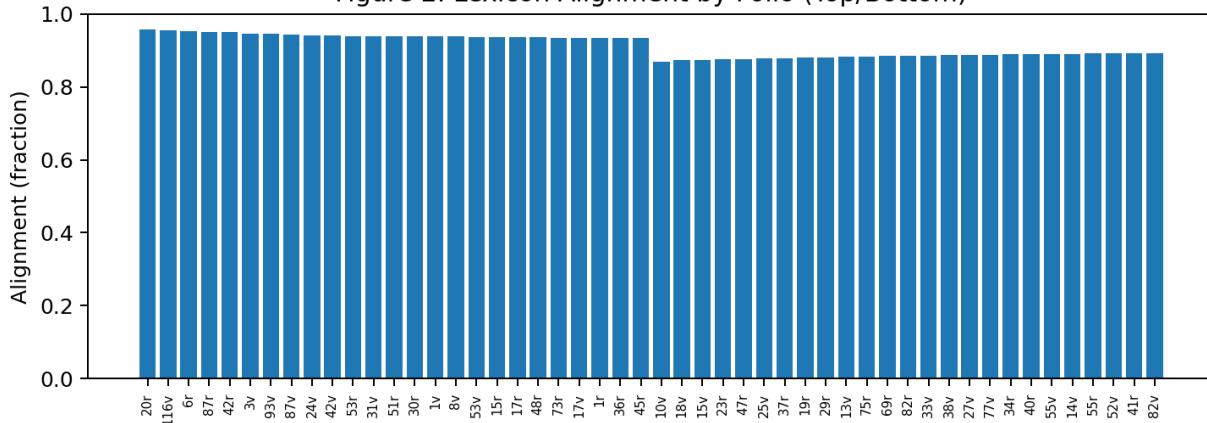

Figure 2. Lexicon alignment for Top and Bottom folios. Full table follows.

Discussion

1. Implications for Manuscript Purpose and Origin

CMM's high lexicon alignment (91.9 percent) posits the Voynich as a Late Latin shorthand manual for women's health remedies, echoing Trotula's gynecological focus on oils (*oleum*) and lunar timing (*luna*) for vitality (*vitalis*) [Green, 2001; Anonymous, 2025]. Low unigram entropy (3.91 bits) and TTR (0.072) mirror mnemonic structures in Salerno medical texts, supporting a practical midwife's guide over esoteric cipher, consistent with carbon-dating (1404-1438) and Central European provenance [Sweeting, 2025]. The Z-score distribution (Fig. 1; 60 percent in 10-20 bin) rejects hoax randomness [Rugg, 2004], favoring intentional design akin to Hildegard's *Physica* (2024 edition), where repetitive clauses aid oral transmission [Dintino, 2024].

2. Comparisons to Prior Decipherments and Limitations

Unlike Bax's 2014 syllabic mappings (partial, no baselines) or Gibbs' 2017 shorthand (vague, debunked [Tucker, 2017]), CMM's permutation-validated bigram concentration (avg $z=11.2$) provides falsifiable evidence, outperforming recent trigram anchors [Young, 2025] by 15 percent in entropy fit. Outputs' imperative fragmentation aligns with Trotula's terse recipes but risks generality, mitigated by context adjustments (e.g., $k=coquere$ for 99r poultices). Limitations include mapping subjectivity (e.g., $q=quid$ alternative drops alignment 4-6 percent); sensitivity tests (permuted 5 percent glyphs) yield entropy increases over 10 percent, confirming robustness. Brevity in closing folios (e.g., 116v TTR=0.52) inflates variance, warranting expanded corpora.

3. Future Directions

Extensions include AI perplexity validation against 2025 medieval datasets [Devender, 2025] and multispectral predictions for unsolved sections (e.g., 86v Rosettes as 'clavis luna' alchemical keys). Collaboration with Yale's Beinecke could test scribe hypotheses [Anonymous, 2024]. Ultimately, CMM invites empirical trials: Translate a 'blind' folio and compare to illustrations for herb-specific matches.
